1. Ordenar las siguientes funciones de menor a mayor orden:

- | | | | |
|---------------------|-----------------|----------------|--|
| 1. n | 5. 2^n | 9. $n \log n$ | 13. $\ln n$ |
| 2. $n - n^3 + 7n^5$ | 6. $\log n$ | 10. \sqrt{n} | 14. e^n |

- 1) $\log(\log(n))$
- 2) $\log(n)$
- 3) $(\log(n))^2$
- 4) $\ln(n)$
- 5) \sqrt{n}
- 6) n
- 7) $n \log(n)$
- 8) n^2
- 9) $n^2 + \log(n)$
- 10) n^3
- 11) $2^{(n-1)}$
- 12) 2^n
- 13) $n!$
- 14) e^n
- 15) $n - n^3 + 7n^5$

2. Para las siguientes funciones, determinar el resultado como una función de n y representar el peor caso de ejecución con notación Big Oh:

<pre>function mystery(n) r := 0 for i := 1 to n - 1 do for j := i + 1 to n do for k := 1 to j do r := r + 1 return(r)</pre>	<pre>function pesky(n) r := 0 for i := 1 to n do for j := 1 to i do for k := j to i + j do r := r + 1 return(r)</pre>	<pre>function prestiferous(n) r := 0 for i := 1 to n do for j := 1 to i do for k := j to i + j do for l := 1 to i + j - k do r := r + 1 return(r)</pre>
---	---	---

$$\sum_{x=1}^n x = \frac{1}{2} n(n+1)$$

$$\sum_{j=i+1}^n j = \sum_{j=1}^n j - \sum_{j=1}^i j$$

$$\sum_{x=1}^n x^2 = \frac{1}{6} n(n+1)(2n+1)$$

3. Implementar el algoritmo de *insertion sort* para ordenar en orden descendente en vez de ascendente.

```

3 def insertionSortElement(new_el, sequence):
4     index = 0
5     while index < len(sequence) and new_el < sequence[index]: #Se cambia el simbolo del condicional entre new_el y sequence[index]
6         index+=1
7     return sequence[:index] + [new_el] + sequence[index:]
8
9 def insertionSort(sequence):
10    for index in range(1,len(sequence)):
11        elem = sequence[index]
12        sequence = insertionSortElement(elem, sequence[:index]) + sequence[index+1:]
13    return sequence

```

Se cambia el símbolo de ">" por el "<" debido a que vamos a empezar desde el mas grande al mas pequeño
